#### Fungicide Utility

The compounds of the present invention have been found to control fungi, particularly plant pathogens. When employed in the treatment of plant fungal diseases, the compounds are applied to the plants in a disease inhibiting and phytologically acceptable amount. As used herein, the term "disease inhibiting and phytologically acceptable amount", refers to an amount of a compound of the present invention which kills or inhibits the plant disease for which control is desired, but is not significantly toxic to the plant. This amount will generally be from about 1 to 1000 ppm, with 10 to 500 ppm being preferred. The exact concentration of compound required varies with the fungal disease to be controlled, the type formulation employed, the method of application, the particular plant species, climate conditions and the like. A suitable application rate is

typically in the range from about 0.10 to about 4 lb/A. The compounds of the invention may also be used to protect stored grain and other non-plant loci from fungal infestation.

5

The following experiments were performed in the laboratory to determine the fungicidal efficacy of the compounds of the invention.

10 The test compounds were formulated for application by foliar spray. The following plant pathogens and their corresponding plants were employed.

Pathogen	Designation in following Table	Host
<i>Erysiphe graminis tritici</i> (powdery mildew)	PMW	wheat

15

Screening Method for PMW:

Wheat c.v. Monon was grown in the greenhouse from seed in a soil-less peat-based potting mixture ("Metromix"). The seedlings were used for testing at the 1.5 leaf stage.

20 Compound formulation was accomplished by dissolving technical materials in acetone, with serial dilutions then made in acetone to obtain desired rates. Final treatment volumes were obtained by adding nine volumes 0.011% aqueous Triton X-100, resulting in test solutions with 10% acetone  
25 and 0.01% Triton X-100. Test rates were 400, 100, 25, and 6.25ppm.

In a high volume foliar application, plants were sprayed to runoff (using two opposing Spraying Systems  
30 1/4JAUPM air atomization nozzles operated at approximately 138 kPa. Test inoculum for wheat powdery mildew (*E. graminis f. sp. tritici*) was produced in vivo on stock plants in the greenhouse. The test plants were inoculated by dusting spores from stock plants on test plants 24 hours  
35 after spray application

After inoculation the test plants were kept in the greenhouse for seven days, until disease on the untreated control plants was fully developed. Seven days after inoculation, the disease incidence on the leaves was  
5 assessed visually.

The following table presents the activity of typical compounds of the present invention when evaluated in these experiments. The effectiveness of test compounds in  
10 controlling disease was rated using the following scale.

The compounds of this invention are made using well known chemical procedures. The required starting materials are commercially available, or readily synthesized utilizing standard procedures, several of which are disclosed in U.S. Patent 5,145,843. The compounds of formula (1) are then prepared by reduction of the corresponding quinolines with suitable reducing agents, such as, for example, diisobutylaluminium hydride, in a suitable solvent, such as, for example, ether, and subsequent acylation.

The following nonlimiting example further illustrates this invention.

#### Example 1

#### 1-Methoxycarbonyl-5,7-dichloro-4-(4-fluorophenoxy)-1,2-dihydroquinoline

To a stirred suspension of 5,7-dichloro-4-(4-fluorophenoxy)-quinoline (0.62 gm, 2 mmol) in dry ether (10 ml) at room temperature was added a solution of diisobutylaluminium hydride (2.5 ml; 1M in THF). After 30 minutes, methyl chloroformate (0.5 ml) was added while cooling in ice, and the mixture was allowed to stand at room temperature 16 hours. Water was added followed by 1M HCl (4 ml) and the mixture was extracted with ether. Extracts were washed with saturated brine, dried with magnesium sulphate

and evaporated to a viscous oil which crystallized (0.75 gm, 100%). Recrystallisation from ether/hexane gave a colorless solid (mp 110°). Found: C: 55.66, H: 3.31, N: 3.55; C<sub>17</sub>H<sub>11</sub>NCl<sub>2</sub>FO<sub>3</sub> requires: C: 55.61, H: 3.02, N: 3.81%.  $\delta$ (CDCl<sub>3</sub>) 3.84 (3H s, MeO), 4.29 (2H d J=5Hz, H-2), 5.35 (1H t J=5Hz, H-3), 6.94-7.05 (4H m, 4-fluorophenyl), 7.18 (1H d J=2Hz, H-6), 7.57 (1H br, H-8).

### Example 2

#### 10 5,7-Dichloro-4-(4-fluorophenoxy)- 1,2-dihydroquinoline

The mixture was stirred for 1 hour then quenched with water (3.5 ml) in THF (10ml), then with 10M NaOH (3.5 ml), and finally with water (3.5 ml) with cooling. The mixture was filtered and the filtrate 20 evaporated to a viscous oil (15.05 gm, 97.1%) and stored at -20°.  $\delta$ (CDCl<sub>3</sub>) 4.05 (2H d, J=5Hz, H-2), 5.20 (1H t, J=5Hz, H-3), 6.44 (1H d, J=2Hz, H-6), 6.68 (1H d, J=2Hz, H-8), 6.90-7.05 (4H m, 4-fluorophenyl).

### 25 Example 3

#### 1-Acetyl-5,7-dichloro-4-(4-fluorophenoxy)- 1,2-dihydroquinoline

To 5,7-dichloro-4-(4-fluorophenoxy)-1,2-dihydroquinoline (0.93 gm, 3.00 mmol) and triethylamine (2 ml) in dry dichloromethane (10 ml), cooled to -70°, was added acetyl chloride (0.3 ml, 4.2 mmol). The mixture was allowed to warm to ambient temperature over 2 hours then stood for 20 hours. Water was added, the organic phase 35 separated, washed with brine and evaporated to an oil. Chromatography on flash silica, eluting with dichloromethane gave an oil (0.82 gm, 77.6%).  $\delta$ (CDCl<sub>3</sub>) 2.28 (3H s, CH<sub>3</sub>CO),

4.33 (2H br, H-2), 5.39 (1H t, J=5Hz, H-3), 6.95-7.07 (4H m, 4-fluorophenyl), 7.27 (2H s, H-6,8).

To 5,7-dichloro-4-(4-fluorophenoxy)-1,2-dihydroquinoline (1.55 gm, 5 mmol) and triethylamine (2.5 ml) in dry dichloromethane (25 ml), cooled to -70°, was added trifluoroacetic anhydride (1.3 ml, 10 mmol) over one minute. The mixture was allowed to warm to ambient temperature over 2 hours then stood for 20 hours. Water was added, the organic phase separated, washed with brine and  
15 evaporated to an oil which solidified (2.02 gm, 99.5%) and recrystallized from hexane (m.p. 106.5°).  $\delta$ (CDCl<sub>3</sub>) 4.25 (2H br, H-2), 5.39 (1H t, J=5Hz, H-3), 6.98-7.10 (4H m, 4-fluorophenyl), 7.37 (1H d, J=2Hz, H-6), 7.64 (1H br, H-6).

#### Example 5

The compounds of this invention are applied in the form of compositions, which are important embodiments of the invention, and which comprise one or more compounds of formula (1) with a phytologically-acceptable inert carrier. The composition may optionally include fungicidal combinations which comprise at least 1% of one or more compounds of formula (1) with another fungicide.

The compositions are either concentrated formulations which are dispersed in water for application, or are dust or granular formulations which are applied without further

treatment. The compositions are prepared according to procedures which are conventional in the agricultural chemical art, but which are novel and important because of the presence therein of the compounds of this invention.

5 Some description of the formulation of the compositions will, however, be given to assure that agricultural chemists can readily prepare any desired composition.

The dispersions in which the compounds are applied are most often aqueous suspensions or emulsions prepared from concentrated formulations of the compounds. Such water-soluble, water suspendable, or emulsifiable formulations are either solids usually known as wettable powders, or liquids usually known as emulsifiable concentrates or aqueous suspensions. Wettable powders, which may be compacted to form water dispersible granules, comprise an intimate mixture of the active compound, an inert carrier and surfactants. The concentration of the active compound is usually from about 10% to 90%. The inert carrier is usually chosen from among the attapulgite clays, the montmorillonite clays, the diatomaceous earths, or the purified silicates. Effective surfactants, comprising from about 0.5% to about 10% of the wettable powder, are found among the sulfonated lignins, the naphthalenesulfonates, alkylbenzenesulfonates, the alkyl sulfates, and non-ionic surfactants, such as, for example, ethylene oxide adducts of alkyl phenols.

Emulsifiable concentrates of the compounds comprise a convenient concentration of a compound, such as from about 10% to about 50% of liquid, dissolved in an inert carrier, which is either a water miscible solvent or a mixture of water-immiscible organic solvents, and emulsifiers. Useful organic solvents include aromatics, especially the high-boiling naphthalenic and olefinic portions of petroleum such as heavy aromatic naphtha. Other organic solvents may also be used, such as, for example, terpenic solvents, including rosin derivatives, aliphatic ketones, such as cyclkohexanone, and complex alcohols, such as 2-

ethoxyethanol. Suitable emulsifiers for emulsifiable concentrates are chosen from conventional nonionic surfactants, such as those mentioned above.

5       Aqueous suspensions comprise suspensions of water-insoluble compounds of this invention, dispersed in an aqueous vehicle at a concentration in the range from about 5% to about 50%. Suspensions are prepared by finely grinding the compound, and vigorously mixing it into a  
10       vehicle comprised of water and surfactants chosen from the same types discussed above. Inert ingredients, such as inorganic salts and synthetic or natural gums, may also be added, to increase the density and viscosity of the aqueous vehicle. It is often most effective to grind and mix the  
15       compound at the same time by preparing the aqueous mixture, and homogenizing it in an implement such as a sand mill, ball mill, or piston-type homogenizer.

          The compounds may also be applied as granular  
20       compositions, which are particularly useful for applications to the soil. Granular compositions usually contain from about 0.5% to about 10% of the compound, dispersed in an inert carrier which consists entirely of in large part of clay or a similar inexpensive substance. Such compositions  
25       are usually prepared by dissolving the compound in a suitable solvent, and applying it to a granular carrier which has been pre-formed to the appropriate particle size, in the range of from about 0.5 to 3 mm. Such compositions may also be formulated by making a dough or  
30       past of the carrier and compound, and crushing and drying to obtain the desired granular particle.

          Dusts containing the compounds are prepared simply by intimately mixing the compound in powdered form with a  
35       suitable dusty agricultural carrier, such as, for example, kaolin clay, ground volcanic rock, and the like. Dusts can suitably contain from about 1% to about 10% of the compound.
